

MAICO® MEMS confocal unit C15890 series

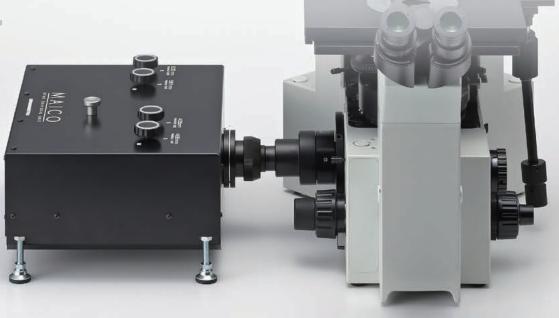

Confocal fluorescence unit installed in your own microscope

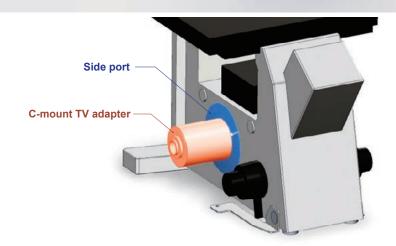

MAICO® MEMS confocal unit is a confocal unit easily installed on your inverted microscope to achieve confocal fluorescence imaging.

This compact, bench-top unit, does not require other devices such as cameras, filters or lasers.

As an entry-level model, or as a sub-model of a high-end confocal fluorescence microscope, MAICO® makes confocal fluorescence imaging more accessible.

MAICO® is mounted via a side port of the inverted microscope with a C-mount TV adapter.

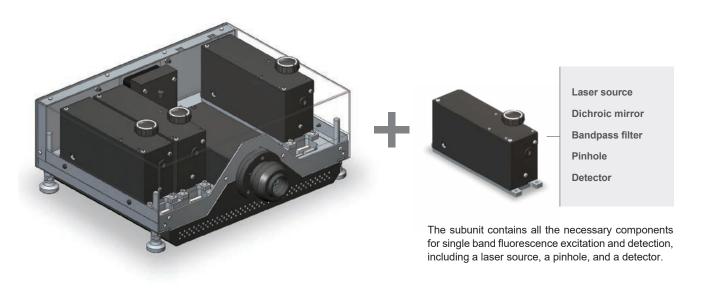

Our modular subunit structure makes adding extra channels easy

MAICO® has a unique subunit structure which contains all the necessary components for each fluorescence band excitation and detection in a single unit.

By adopting the subunit structure you can, for example, select a single fluorescence band when you purchase your first unit. You can then add more imaging channels as your research progresses.

MAICO® supports single channel observation as well as up to four multi-channel (405 nm, 488 nm, 561 nm, and 638 nm) simultaneous excitation and observation.

High-sensitivity detectors

Hamamatsu Photonics' detectors have a long track record in the field of fluorescence measurement. By adopting the world's most sensitive detector (photomultiplier tube) and applying our signal processing know-how, we were able to reduce the laser power to a Class 3R with sufficient fluorescence signals.

This has important implications for live cell imaging, such as long time-lapse imaging.

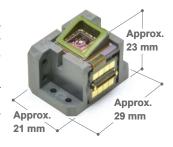

High-speed scanning with MEMS mirror

We adopted our 29 kHz resonant type high-speed MEMS* mirror as a spot scanning device. The MEMS mirror allows for a high-speed scan up to 76 frames/s and can be used for high-speed phenomena such as Ca²⁺ dynamics.

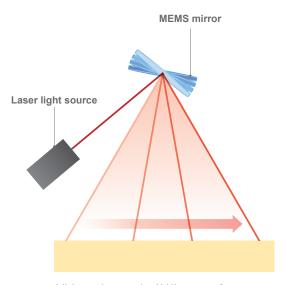

The high-speed resonant scanning system reduces laser irradiation time, which enables low phototoxicity, low photobleaching and high-efficiency observation of live cells as well as fixed samples.

High-speed scanning allows for comfortable observation at high resolution with minimal display delay when searching for and focusing on samples.

Our MEMS mirror developed for applications such as laser scanning microscopy.

* MEMS = Micro-Electro-Mechanical Systems

A light spot is scanned at 29 kHz resonant frequency.

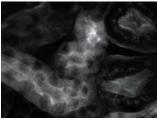

Conventional confocal optics

MAICO® was designed to comply to the conventional confocal optics, which has a long history, using a spot scanning device and pinholes to acquire optical sectioning images.

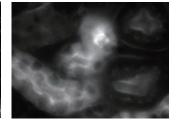

When imaging thick fluorescence samples, only the fluorescence emitted from the focal plane of the objective passes through the pinholes to the detector, while fluorescence emitted from further away from the focal plane is blocked.

It detects quantitative, reproducible and reliable signals. It also acquires high contrast images without the need for image processing techniques, such as deconvolution.

MAICO® image

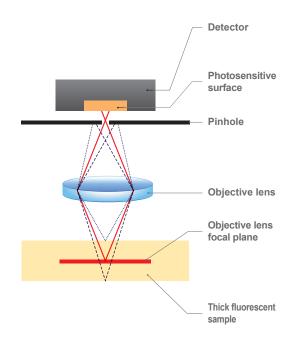

Widefield microscope image

Sample: Mouse kidney section

 $\label{eq:main_main} \textbf{MAICO}^{\circledcirc} \ \text{detects fluorescence in the objective focal plane only, so high contrast optical sectioning images can be acquired.}$

No laser control area required

As MAICO® utilizes our most sensitive detectors and signal processing know-how, we were able to successfully reduce the laser power to a Class 3R. Therefore, you can use MAICO® in a normal laboratory environment, without the need for a laser controlled area.

Software support

MAICO® is compatible with DCAM-API®, a common camera library, and can be controlled by Hamamatsu's HCImage software. It is also possible to acquire images with DCAM-API® compatible third party software.

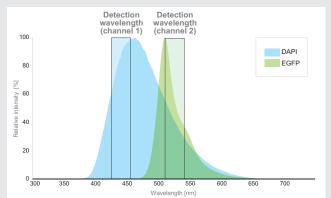

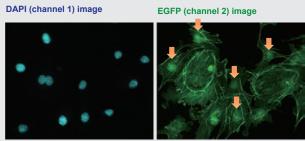

Enable simultaneous multiband confocal

acquisition without bleed-through (Patent pending)

Conventional simultaneous multiband observation

Fluorescent dyes emit a wide wavelength range of fluorescence, and if multiple fluorescent dyes are used, the fluorescence distributions are generally overlapped. When multiple dyes are excited simultaneously, an overlapping emission spectrum leaks into adjacent detection channels, causing an artifact of fluorescence imaging called bleed-through. The bleed-through cannot be prevented by simply using a dichroic mirror or a bandpass filter to select the wavelength, and this has been a problem.

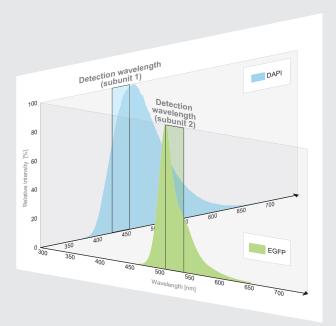

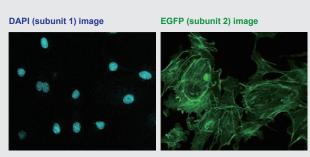

DAPI fluorescence leaks into the EGFP detection channel and causes artifact shapes of the nucleus in EGFP image. (Images are shown in pseudo-color.)

Newly developed

Simultaneous multiband observation without bleed-through

Since MAICO® has a subunit structure, we can design the light path in each subunit independently. This minimizes the bleed-through to adjacent subunits and enables simultaneous multiband observation with high detection efficiency.

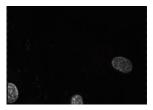

Simultaneous multiband excitation does not cause DAPI fluorescence bleed-through into the EGFP detection channel, and each fluorescent dye image is acquired accurately. (Images are shown in pseudo-color.)

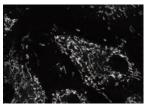

Live cell four-color imaging

Confocal imaging of cell nucleus, mitochondria, cell membrane, and actin filament with different dyes and channels. Each structure is clearly observed.

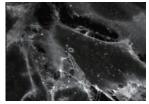

Sample: H9c2 cell line Objective lens: 60× Number of scan lines: 960 Laser wavelength: 405 nm, 488 nm, 561 nm, 638 nm

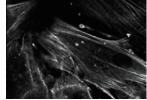

Wavelength 405 nm: Cell nucleus (HCS NuclearMask)

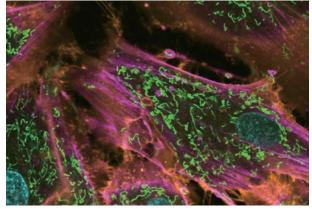

Wavelength 488 nm: Mitochondria (MitoTracker)

Wavelength 561 nm: Cell membrane (CellMask)

Wavelength 638 nm: Actin (SiR-Actin)

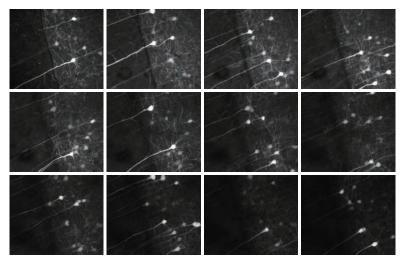

Superimposed four-color fluorescence image. (Image is shown in pseudo-color.)

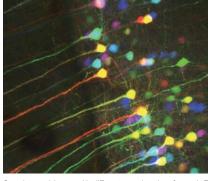

Z-section imaging of mouse brain

These confocally sectioned images show that the structure of the cells and neurons in this thick section of mouse brain are pyramidal in volumetric shape.

Sample and images courtesy of Dr. Christian Jüngst and Dr. Astrid Schauss (CECAD Imaging Facility, University of Cologne)
Sample: Fixed sample of transgenic mouse brain (Thy1-eYFP)
Objective lens: 20× (NA: 0.40)
Laser wavelength: 488 nm

These images were acquired in 5 μm steps across a 200 μm thickness in tissue. Images shown in every 3 slices.

Superimposed image with different pseudo-colors for each Z position.

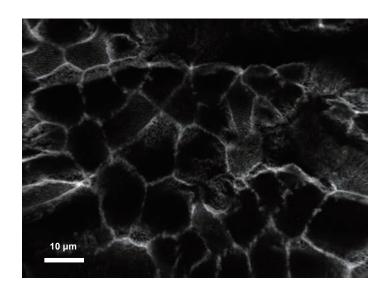

Imaging examples

Actin structural imaging of mouse tracheal epithelial cells

The actin structure in the cell can be clearly observed.

Sample and image courtesy of Kyosuke SHINOHARA Ph.D. Associate Professor, Department of Biotechnology and Life Science, Graduate School of Technology, Tokyo University of Agriculture and Technology Sample: Mouse tracheal epithelial cell (Phalloidin-Alexa568) Objective lens: 100× (NA: 1.30) Laser wavelength: 561 nm

Application examples

- · Live cell imaging
- High-speed Ca²⁺ imaging
- · Membrane potential dye imaging

- Time-lapse imaging
- 3D/4D imaging

Selectable wavelength and detection sensitivity

		Type number	Wavelength	Detector	
Main unit		C15890-405N	405 nm	Standard type	
		C15890-488N 488 nm	488 nm		
		488 nm	High sensitivity type (Crystalline photocathode/GaAsP)		

The A15892-01 mechanical shutter is available as a factory option.

Up to 4 imaging channels can be supported if you add

Subunit

	Type number			
	Purchased with the main unit	Add or replace at a later date	Wavelength	Detector
	A15889-405N	A15891-405N	405 nm	Standard type
	A15889-488N	A15891-488N	488 nm	
	A15889-561N	A15891-561N	561 nm	
Subunit	A15889-638N	A15891-638N	638 nm	
	A15889-488S	A15891-488S	488 nm	High sensitivity type
	A15889-561S	A15891-561S	561 nm	(Crystalline photocathode/ GaAsP)
	A15889-638S	A15891-638S	638 nm	

It is not possible to install two or more subunits with the same laser wavelength. Also, replacement of the detector alone is not possible.

Different laser lines and their detectors can be added or removed based on the subunit selection.

Specifications

Specifications

Turn rumber (045,000					
Type number		C15890 series			
Maximum effective		8.0 mm × 6.0 mm			
Maximum numbe	r of pixels	1280 (H) × 960 (V)			
Image size		1280 (H) × 960 (V)			
		1280 (H) × 480 (V)			
		1280 (H) × 240 (V)			
Frame rate	960 scanning lines	19 frames/s			
(Typ.)	480 scanning lines	38 frames/s			
	240 scanning lines	76 frames/s			
Zoom function		1×, 2×			
Excitation laser*1		405 nm, 488 nm, 561 nm, 638 nm			
Laser class		Class 3R			
Detection	at 405 nm excitation	425 nm to 465 nm			
wavelength	at 488 nm excitation	510 nm to 540 nm			
	at 561 nm excitation	580 nm to 619 nm			
	at 638 nm excitation	660 nm to 730 nm			
Detector*2		PMT, high-sensitivity GaAsP PMT			
Digital output		12 bit			
Image acquisition	n mode	Single channel measurement, multiple channel sequential measurement (frame by frame), multiple channel simultaneous measurement (up to 4 channels)			
Pinhole*3		3 manual selections (large/medium/small) for each wavelength			
Compatible object	tive lens*4	Magnification 20× to 100×			
Interface		USB 3.0			
Output trigger cor	nnector	SMA			
Lens mount		C-mount			
Power consumpti	on	90 VA			
Ambient operating	g temperature	+18 °C to +28 °C			
Ambient operating	g humidity	30 % to 80 % (with no condensation)			
Ambient storage	temperature	-10 °C to +50 °C			
Ambient storage	humidity	85 % (with no condensation)			

- *1 The C15890 series is provided with a single wavelength of 405 nm or 488 nm. Supports up to 4 wavelengths by addition of subunits.
 *2 Equipped with the same number of lasers.

- The pinhole size can be read out as accessory information at the time of measurement.
 We recommend use of an objective lens with an image-side NA (objective lens NA/magnification) smaller than 0.0375.

Laser safety

MAICO® MEMS Confocal Unit is a Class 3R laser product. Conforming to international laser safety standards (IEC 60825-1), which obligate manufacturers to provide preventive safety measures, Hamamatsu lasers are classified, and appropriate safety measures and labeling are provided. During operation, users must also use their preventive safety measures according to laser-related regulations.

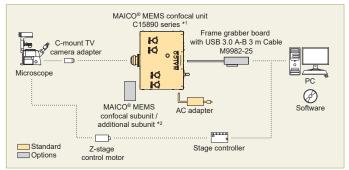

<code>MAICO®</code> is equipped with a key switch and an interlock circuit. If necessary, connect to the safety device via the interlock connector (EIAJ RC5320A TYPE4, M04-390DJ Marushin electric mfg. Co).

System configuration example

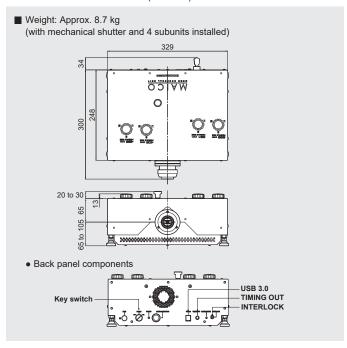

- *1 C15890-405N, -488N, -488S
- *2 For the details of the lineup, refer to page 7.

Option

Type number	Product name		
A15892-01	MAICO® MEMS confocal mechanical shutter		
A15892-488	MAICO® MEMS confocal optical adjustment glass		
A15892-638	MAICO® MEMS confocal optical adjustment glass		
M9982-25	Frame grabber board with USB 3.0 A-B 3 m Cable		
U11158-02	HCImage Acquisition Software		
U11158-08	HCImage Live Software		

*You are able to add these options only at the time of purchase of the main unit. These can not be added
